HG refill moisture absorber granules

HG "moisture absorber granules" are the filling for the HG "moisture absorber".

With the help of the HG "moisture absorber granules", the HG "moisture absorber" brings back the relative humidity to an acceptable level in spaces where it is too damp. This prevents all adverse consequences of excess humidity, such as condensation, a stale smell, mildew, damp spots, vermin and wood rot. The HG "moisture absorber" works on the basis of moisture-drawing granules. The system is silent and works without power or batteries. The round moisture absorber granules used have a larger absorption surface than the often-used flakes and the round shape also creates more space between the granules, enabling more air (with moisture) to flow along the granules. Together with the granule basket, designed for as much air contact as possible, this results in a moisture absorber that is faster, works longer and also extracts 1.5 times more moisture from the air than similar systems. Depending on the relative humidity, an HG "moisture absorber" with 450 grams of HG "moisture absorber granules" will work for 2 to 3 months in a space of around 40 m³. The HG "moisture absorber" is very suitable for caravans, boats, sheds, cellars, closets or other spaces in your home.

The HG "moisture absorber granules" can also be used in all other systems that work with loose moisture-absorbing flakes, as well as in systems that work with ready-to-use refill bags with the moisture-absorbing flakes. Use of the HG "moisture absorber granules" in these (flake) systems will also make these work faster and longer and, furthermore, absorb more moisture from the air (up to 1.5 times). Should these systems have holes that may cause the granules to fall through, simply cut a piece of coffee filter or a tissue to the right size and place it over the holes. This will stop the granules from falling in the container, but will allow the absorbed moisture to leak through.

Instructions HG "moisture absorber granules"

1. Remove the lid from the granule basket.
2. If you are about to use the granule basket for the first time, press the upturned bottom down and secure by clicking it into the basket.
3. Turn the lid off the bottle of HG "moisture absorber granules" and remove the airtight seal.
4. Pour the granules from the bottle into the granule basket.
5. Replace the lid of the granule basket on the basket and put the granule basket back on the HG "moisture absorber".
6. Place the HG "moisture absorber" in the room in question.

Check if there are still beads in the granule basket once a month. If the granule basket is empty, empty the HG "moisture absorber jug" into the drain. To do this, take the granule basket off the HG "moisture absorber jug" and place it in the sink temporarily (take care not to spill any of the "trapped" moisture because it may stain), throw away the "trapped" moisture and, if so desired, replace the granule basket on the jug. Fill the basket with new granules and leave the HG "moisture absorber granules" to do their job! Carefully rinse the sink!

Tip: The "trapped" moisture may stain. If this is the case, clean the stain immediately with lots of water and dab carefully. Repeat if necessary. Any stains can be removed with sodium sulphate. Make a 5% solution in water (50 g/l) and sprinkle it on the stain. Leave to work for around 30 minutes. Then allow the water to evaporate with a blow-drier or electric heater. Hoover up any remaining powder.

Avoid contact with leather and metal because these materials can be affected.

Transport and store the bottle upright.
